

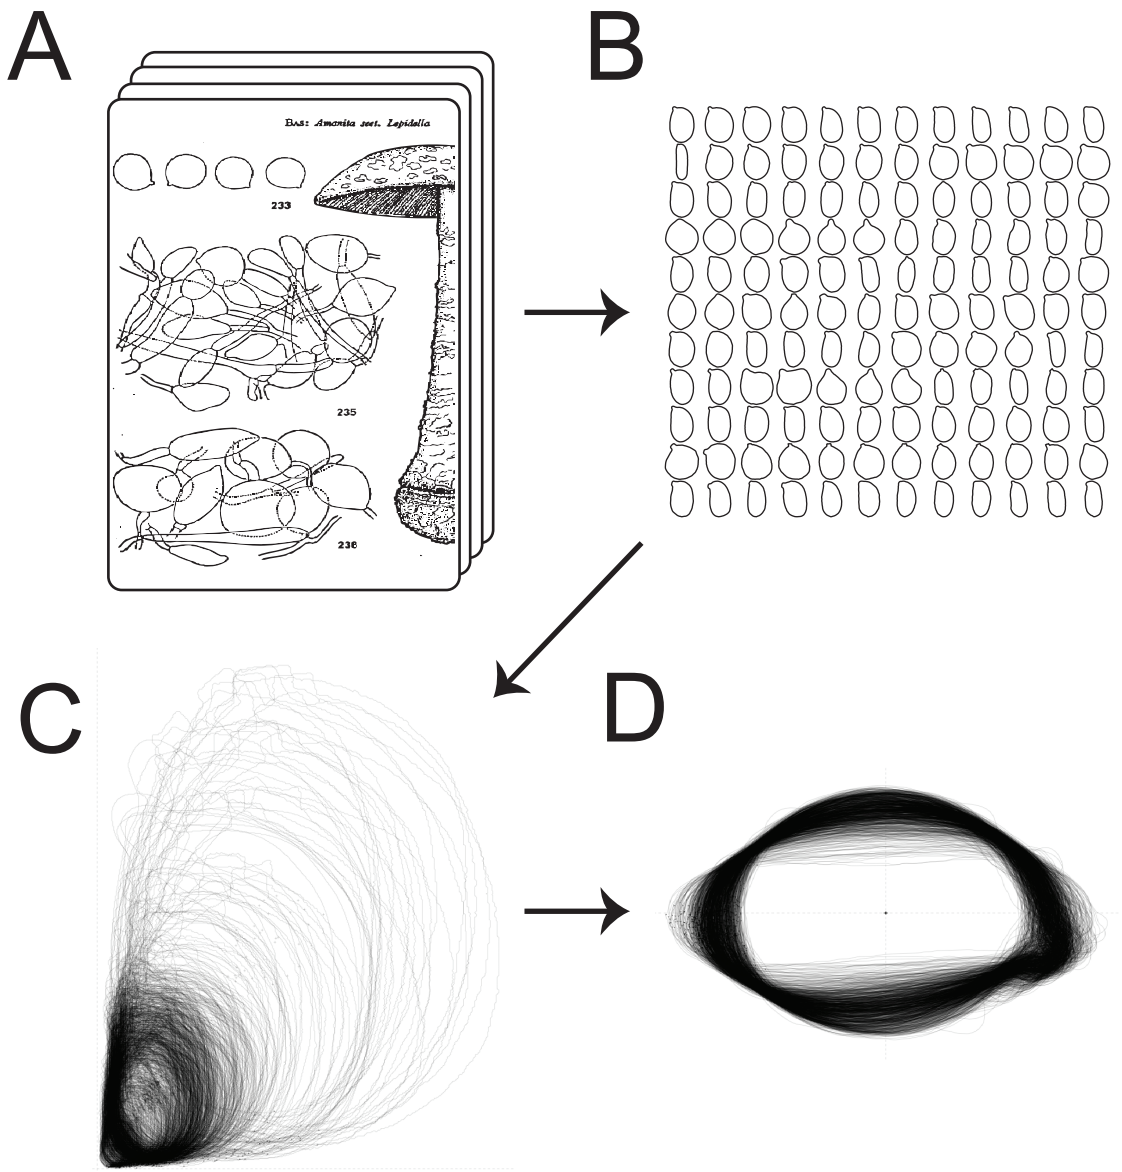

Figure 2. Morphometrics workflow. (a) We digitized spore outlines from the current taxonomic literature. (b) The 1,041 spore outlines represented 212 species, including 208 species of *Amanita* and four close relatives. (c) We oriented and aligned spore outlines using the R package Momocs. In this image hilar appendices are oriented to align in the upper/left direction. (d) We normalized outlines through centering, scaling, and smoothing before Fourier analysis.
